

Statistics 5

Histograms & cumulative frequency SOLUTIONS

Section 1

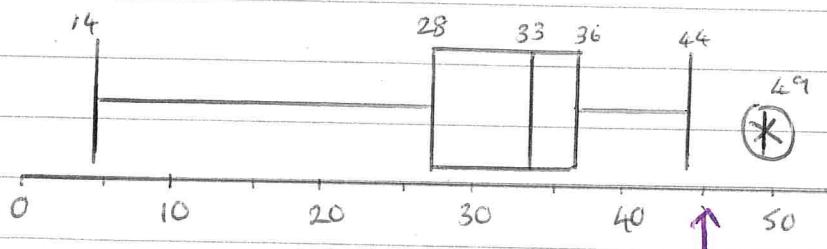

1, a,	1	4 7	$(n=13)$	$Q_1 = \frac{13}{4} = 3.25 \Rightarrow 4^{\text{th}} = \underline{\underline{28}}$
	2	5 8		
	3	1 1 3 4 5 6		$Q_2 = \frac{13}{2} = 6.5 \Rightarrow 7^{\text{th}} = \underline{\underline{33}}$
	4	0 4 9		$Q_3 = \frac{3(13)}{4} = 9.75 \Rightarrow 10^{\text{th}} = \underline{\underline{36}}$

(Also allow $Q_1 = 26.5$, $Q_2 = 33$, $Q_3 = 38$)

$$\begin{aligned} b, \quad Q_1 - 1.5(IQR) &= 28 - 1.5(36-28) \\ &= \underline{\underline{16}} \quad \therefore \text{no outliers} \end{aligned}$$

$$\begin{aligned} Q_3 + 1.5(IQR) &= 36 + 1.5(36-28) \\ &= \underline{\underline{48}} \quad \therefore 49 \text{ is an outlier} \end{aligned}$$

(Also allow boundaries $\Rightarrow 26.5 - 1.5(38-26.5) = 9.25$
 $\Rightarrow 28 + 1.5(38-26.5) = 55.25$

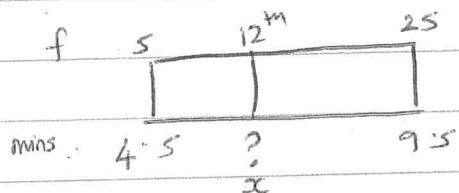

allow top of line to go to 48 (outlier boundary)

(Also allow with values from different quartiles as given before.)

2,

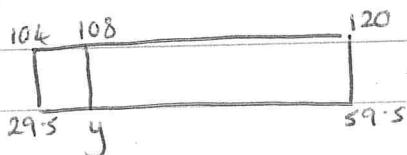

mins	f	cf
0.5 - 4.5	5	5
4.5 - 9.5	20	25
9.5 - 19.5	28	53
19.5 - 29.5	51	104
29.5 - 59.5	16	120

$10\% \text{ of } 120 = 12^{\text{th}}$ $\rightarrow 12^{\text{th}}$ person lies in the group
 $4.5 - 9.5$.

$$\frac{x-4.5}{9.5-4.5} = \frac{12-5}{25-5} \quad x = 6.25.$$

$90\% \text{ of } 120 = 108^{\text{th}} \rightarrow 108^{\text{th}}$ person lies in group $29.5 - 59.5$.

$$\frac{y-29.5}{59.5-29.5} = \frac{108-104}{120-104} \quad y = 37.$$

So Inter-percentile range = $37 - 6.25 = \underline{\underline{30.75}}$

$$3, \quad \bar{x} = \pm 10 \quad S.d_x = \pm 1$$

Scheme A : + 50p per hour

$$\begin{aligned}\bar{y} &= \pm 10.50 \\ S.d_y &= \pm 1\end{aligned}$$

Scheme B : 5% increase
 $= \times 1.05$

$$\begin{aligned}\bar{z} &= \pm 10.50 \\ S.d_z &= \pm 1.05\end{aligned}$$

$$4, \quad y = 2x + 11 \quad x^2 + y^2 - 6x - 4y = 32$$

$$\begin{aligned}x^2 + (2x + 11)^2 - 6x - 4(2x + 11) &= 32 \\ x^2 + 4x^2 + 44x + 121 - 6x - 8x - 44 &= 32\end{aligned}$$

$$5x^2 + 30x + 45 = 0$$

$$x^2 + 6x + 9 = 0$$

$$(x + 3)^2 = 0$$

$$x = -3$$

(Since there is only 1 solution
 for x the line only touches
 the circle once)

Can also use discriminant

$$\begin{aligned}b^2 - 4ac^2 &\\ = 6^2 - 4(1)(9)^2 &\\ = 36 - 36 &\\ = 0 \quad \therefore \text{one solution for } x. &\end{aligned}$$

Section 2

		freq.	freq density	Method
1,	0.5 - 3.5	30	$\frac{30}{3} = 10$	✓
	3.5 - 4.5	96	$\frac{96}{1} = 96$	✓
	4.5 - 5.5	48	$\frac{48}{1} = 48$	✓
	5.5 - 7.5	84	$\frac{84}{2} = 42$	③
	7.5 - 10.5	27	$\frac{27}{3} = 9$	
	10.5 - 15.5	15	$\frac{15}{5} = 3$	

$$f.d = \frac{\text{freq}}{\text{class width}}$$

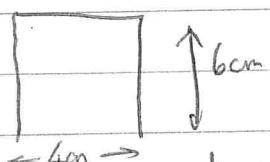

2,a, 21-25 $\Rightarrow 20.5 \leq h < 25.5 \Rightarrow \text{Midpoint} = \underline{\underline{23}}$

31-40 $\Rightarrow 30.5 \leq h < 40.5 \Rightarrow \text{Midpoint} = \underline{\underline{35.5}}$

b, 1-10 $\Rightarrow \circled{0.5} \leq h < \circled{10.5}$ ✓ numbers seen. ①

c, 11-20 $\Rightarrow 10.5 - 20.5$

freq = 15.

Area = $24\text{cm}^2 = 15 \text{ people}$

$1.6\text{cm}^2 = 1 \text{ person}$

26-30 $\Rightarrow 25.5 - 30.5 \Rightarrow \circled{\text{Width} = 2\text{cm}}$

freq = 13

13 people = $13 \times 1.6 = 20.8\text{cm}^2$

Some relation-ship

$\therefore \text{Height} = 10.4\text{cm}$

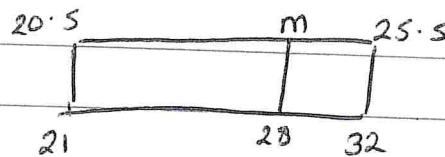

d, mean = 23.5 ✓ (from calculator)

s.d = 10.7 ✓✓✓

⑤

e, Median = $\frac{56}{2} = 28 \Rightarrow 28$ is the 5^{th} value.

28 is in the $21-25$ group $\Rightarrow 20.5 \leq h < 25.5$

$$\frac{m - 20.5}{25.5 - 20.5} = \frac{28 - 21}{32 - 21}$$

$$m = 23.681$$

$$Q_2 = 23.7$$

3, a, $(9.5, 0)$ ✓ $(19.5, 25)$ ✓ Allow $(19.5, 25)$ and $(24.5, 47)$ (2)

b, Because the data is grouped, we do not know the smallest length pebble and/or the largest length pebble. (1)

$$4, a, 1200 \quad Q_1 = 300 \approx 46 \quad \therefore IQR = 70 - 46 = 24$$

$$Q_3 = 900 \approx 70$$

b, $40\% \text{ of } 1200 = 480$ ✓ $1200 - 480 = 720 \rightarrow 64\%$

c, 840 ✓ $1200 - 840 = 360$ ✓
allow $1200 - 860 = 340$ ✓ (2)

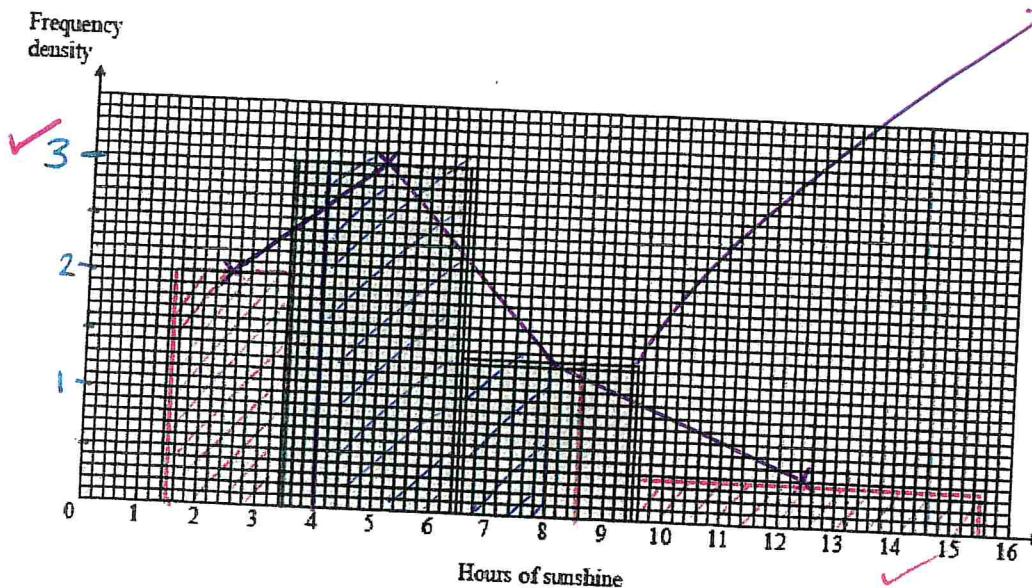

d, $P(\text{all 5 scores} > 68) = \left(\frac{360}{1200}\right)^5 = \frac{243}{100,000} = 0.00243$

Allow $\left(\frac{340}{1200}\right)^5 = 0.00183$ ✓ (3)

Q5, a, The data is grouped, the data is continuous
✓ either ①

Hours of sunshine	0	1-3	4-6	7-9	10-15
Number of days	0	6	9	4	2
f.d.	0	2	3 ✓	1.3	0.3

b,

e, Polygon
(2,2) ①
(5,3) plotted and joined ①
(8,1.3) ①
(12.5,0.3) ①

5
Bars from 0.5-3.5 etc.

- Correct values of x-axis
- Correct heights

c,

$$4-8 \text{ hours} \Rightarrow 4-6.5 \text{ hours} = 2.5 \times 3 = 7.5 \quad \text{①}$$

$$6.5-8 \text{ hours} = 1.5 \times 1.3 = 2 \quad \text{①}$$

$$\Rightarrow \underline{\underline{9.5 \text{ days}}} \quad \text{①}$$

d,

$$\sum x = 114 \quad \sum x^2 = 817.5 \quad n = 21$$

$$\bar{x} = 5.4285$$

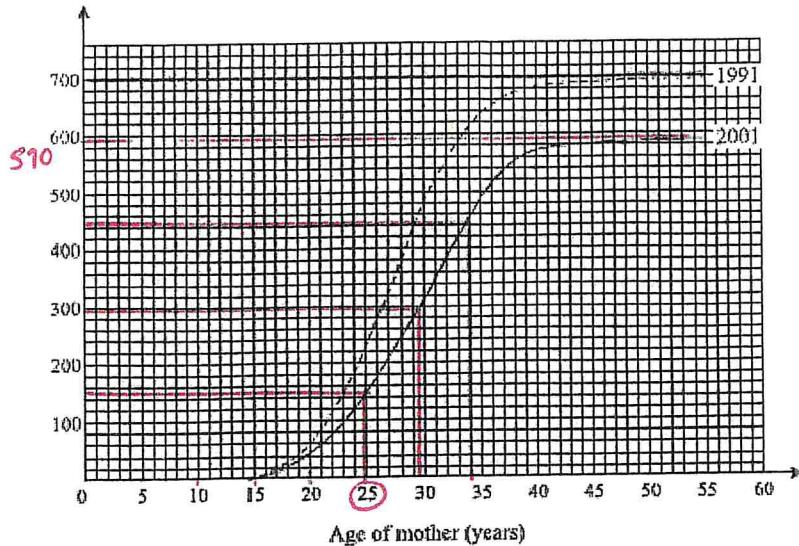

$$= \underline{\underline{5.43 \text{ hours}}} \quad \checkmark$$

$$\begin{aligned} s.d. &= \sqrt{\frac{\sum x^2}{n} - \left(\frac{\sum x}{n}\right)^2} = \sqrt{\frac{817.5}{21} - \left(\frac{114}{21}\right)^2} \\ &= 3.07557 \\ &= \underline{\underline{3.08}} \quad \text{or} \quad \underline{\underline{3.1}} \quad \checkmark \end{aligned} \quad \text{②}$$

e, See above.

6, cont.

Cumulative frequency (000's)

Year	Median age (years)	Interquartile range (years)	Proportion of mothers giving birth aged below 25	Proportion of mothers giving birth aged 35 or above
1991	27.5	7.3	33%	9%
2001	29.5	9	25% ✓	18%

Others
OK
e.g. 29

6, a, 1991 → more births, by ≈ 110 ✓ (2)

$$b, i) Q_2 = \frac{590}{2} = 295^{\text{th}} = 29.5$$

$$Q_1 = \frac{590}{4} = 147.5^{\text{th}} = 25$$

$$Q_3 = \frac{3}{4}(590) = 442.5^{\text{th}} = 34$$

$$\therefore IQR = 9$$

See table below.
above ↑

ii) The mothers in 2001 tended to be older than the women who gave birth in 1991. The median age in 2001 was greater than 1991. The proportion of 'younger' mothers (below 25) was lower in 2001, and the proportion of 'older' mothers (over 35) was higher in 2001. However there is a slightly larger spread of data in 2001. ✓ (2) Any 2 sensible comments!
