

AS COMPUTER SCIENCE (7516/D)

Paper 1

Date

Morning

1 hour 30 minutes

Materials

- For this paper you must have access to:
 - a computer
 - a printer
 - appropriate software.
 - An electronic version of the Skeleton Program and Data File.
- A hard copy of the **Preliminary Material**.

Instructions

- Type the information required on the front of your **Electronic Answer Document**.
- Enter your answers into the **Electronic Answer Document**.
- Answer all questions.
- Before the start of the examination make sure your **centre number**, **candidate name** and **candidate number** are shown clearly in the footer of every page of your **Electronic Answer Document** (not the front cover).
- Tie together all your printed **Electronic Answer Document** pages and hand them to the invigilator.

Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 75.
- No extra time is allowed for printing and collating.
- The question paper is divided into three sections.
- You are **not** allowed to use a calculator.

Advice

- You are advised to spend time on each section as follows: Section A – 20 minutes Section B – 20 minutes Section C – 50 minutes.
- Save your work at regular intervals.

Section A
You are advised to spend no more than 20 minutes on this section.
Enter your answers to Section A in your Electronic Answer Document.
You must save this document at regular intervals.
The question in this section asks you to write program code starting from a new
program/project/file.
Save your program/project/file in its own folder/directory.You are advised to save your program at regular intervals.
0 1 Figure 1 contains the pseudo-code for a program to output a sequence according to the 'Fizz Buzz' counting game.
Figure 1
OUTPUT "How far to count?"
INPUT HowFar WHILE HowFar < 1
OUTPUT "Not a valid number, please try again."
INPUT HowFar
ENDWHILE
FOR MyLoop \leftarrow 1 TO HowFar
IF MyLoop MOD $3 = 0$ AND MyLoop MOD $5 = 0$
THEN
OUTPUT "FizzBuzz"
ELSE IF Myloop MOD 3 = 0
THEN
OUTPUT "Fizz"
ELSE
IF MyLoop MOD $5 = 0$
THEN OUTDUT "Dues"
OUTPUT "Buzz" ELSE
OUTPUT MyLoop
ENDIF
ENDIF
ENDIF
ENDFOR

What yo	u need to do:			
W	Write a program that implements the pseudo-code as shown in Figure 1.			
	Test the program by showing the result of entering a value of 18 when prompted by the program.			
	Test the program by showing the result of entering a value of -1 when prompted by the program.			
	e that you need to provide ne following in your Electronic Answer Document.			
01.1	Your PROGRAM SOURCE CODE for the pseudo-code in Figure 1. [8 marks]			
0 1 . 2	SCREEN CAPTURE(S) for the tests conducted when a value of 18 is entered by the user and when a value of -1 is entered by the user.			
	[1 mark]			
	The main part of the program uses a FOR repetition structure.			
0 1 . 3	Explain why a FOR repetition structure was chosen instead of a WHILE repetition structure.			
	[1 mark]			
	Even though a check has been performed to make sure that the variable HowFar is greater than 1 there could be inputs that might cause the program to terminate unexpectedly (crash).			
01.4	Provide an example of an input that might cause the program to terminate and describe a method that could be used to prevent this.			
	[3 marks]			
	Question 1 continues on the next page			

	Programs written in a high levent than programs written in a low	el language are easier to understand and maintain level language.			
	The use of meaningful identifier names is one way in which high level languages can be made easier to understand.				
01.5	State three other features of high level languages that can make high level language programs easier to understand.				
		[3 marks]			
	The finite state machine (FSM alphabet of a and b.) shown in Figure 2 recognises a language with an			
	Figure 2				
		a 2 b			
	\sim	a			
	Input strings of a and aabba	would be accepted by this FSM.			
01.6	In Table 1 indicate whether early by the FSM in Figure 2 .	ich input string would be accepted or not accepted			
	If an input string would be acc If an input string would not be				
	Copy your answer in Table 1	nto the Electronic Answer Document.			
	Table 1				
	Input string	Accepted by FSM?			
	aaab				
	abbab				
	bbbba				
		[2 marks]			
01.7	In words, describe the languag FSM shown in Figure 2 .	ge (set of strings) that would be accepted by this

Turn over for Section B

	Section B			
	You are advised to spend no more than 20 minutes on this section.			
	Enter your answers to Section B in your Electronic Answer Document.			
	You must save this document at regular intervals.			
The	ese questions refer to the Preliminary Material and require you to load the Sk Program , but do not require any additional programming.	eleton		
Refer ei	ther to the Preliminary Material issued with this question paper or your elect	ronic copy.		
02	State the name of an identifier for:			
02.1	an array or list variable			
		[1 mark]		
02.2	a user-defined subroutine that has four parameters			
		[1 mark]		
02.3	a variable that is used to store a whole number.			
		[1 mark]		
02.4	a user-defined subroutine that returns one or more values.			
		[1 mark]		
	Look at the repetition structures in the DisplayCavern subroutine.			
02.5	Explain the need for a nested FOR loop and the role of the Count1 and variables.	Count2		
		[3 marks]		
	Look at the ResetCavern subroutine.			
02.6	Why has a named constant been used instead of the numeric value 5?			
		[2 marks]		

	Look at the SetPositionOfItem subroutine.
02.7	Describe the purpose of the iterative loop and the command within it in this subroutine.
	[3 marks]
	Look at the MakeMonsterMove subroutine.
02.8	Describe why it is necessary to check if the monster moves into the same cell as
	the flask and how any problem caused by this is solved by the Skeleton Program.
	[3 marks]
	Look at the PlayGame subroutine.
02.9	Explain why a FOR loop has not been used as the iterative structure to complete
	the two moves for the monster. [2 marks]
	The subroutines in the Skeleton Program avoid the use of global variables: they
	use local variables and parameter passing instead.
02.10	State two reasons why subroutines should, ideally, not use global variables.
	[2 marks]
	END OF SECTION B
	Turn to page 9 for Section C

There are no questions printed on this page

	Section C			
	You are advised to spend no more than 50 minutes on this section.			
Enter your answers to Section C in your Electronic Answer Document.				
	You must save this document at regular intervals.			
These que	These questions require you to load the Skeleton Program and to make programming changes to it.			
0 3	This question refers to the subroutines CheckValidMove and PlayGame.			
	The Skeleton Program currently does not make all the checks needed to ensure that the move entered by a player is an allowed move. It should not be possible to make a move that takes a player outside the 7x5 cavern grid.			
	The Skeleton Program is to be adapted so that it prevents a player from moving north if they are at the northern end of the cavern.			
	The subroutine CheckValidMove needs to be adapted so that it returns a value of False if a player attempts to move north when they are at the northern end of the cavern.			
	The subroutine PlayGame is to be adapted so that it displays an error message to the user if an illegal move is entered. The message should state "That is not a valid move, please try again.".			
	nat you need to provide following in your Electronic Answer Document.			
03.1	Your amended PROGRAM SOURCE CODE for the subroutine CheckValidMove.			
	[4 marks]			
03.2	Your amended PROGRAM SOURCE CODE for the subroutine $PlayGame$.			
	[1 mark]			
03.3	SCREEN CAPTURE(S) for a test run showing a player trying to move north when they are at the northern end of the cavern.			
	[1 mark]			

Γ

0 4	This question refers to the PlayGame subroutine and will extend the functionality
	of the game.
	A scoring system is to be implemented as a game of MONSTER! is played. A variable called Score will be used to store the current score of each player.
	The final score will be displayed to the user at the end of the game. At the end of the game, either the player will have found the flask or the player will have been eaten by the monster.
	The final score should be displayed with the message "Your score was: Y" where Y is the value of Score.
	The scoring system will be based upon the following:
	 each valid move by the player is +10 points finding the flask is +50 points setting off a trap is -10 points
	 being killed by the monster is -50 points.
	Task 1
	Adapt the Skeleton Program so that the scoring system described above is implemented, with the value of Score being updated as indicated and the required message being displayed at the end of a game.
	Task 2 Test that the changes you have made work by conducting the following test:
	play the training game
	 move south move south
	 move east.
	at you need to provide Ilowing in your Electronic Answer Document.
04.1	Your amended PROGRAM SOURCE CODE for the subroutine PlayGame and (if relevant) the PROGRAM SOURCE CODE for any other subroutine(s) you have amended.
	[8 marks]
04.2	SCREEN CAPTURE(S) showing the required test.
	[1 mark]

0 5 This question will extend the functionality of the game.

The player will now have access to a close-range trap detector. After making a directional move in the cavern, the trap detector will perform a sweep of the neighbouring cells and report back if a trap is detected. Unfortunately, the detector can only detect the presence of a trap in a neighbouring cell, and not which individual cell the trap is in.

In **Figure 3** the shaded cells show the cells that would be scanned by the trap detector if the player were in the cell marked P1 or P2. The trap detector cannot scan outside the cavern.

Figure 3

P1			
		P2	

Task 1

Create a new subroutine, TrapDetector, that, when given the current location of the player, returns True if a trap is in a neighbouring cell and False if there is no trap in a neighbouring cell.

When creating this subroutine you should ensure that your solution is efficiently coded.

Task 2

Modify the PlayGame subroutine so that after the player moves and the new state of the cavern is displayed:

- the message `Trap detected' is displayed if there is a trap in any neighbouring cell.
- the message `No trap detected' is displayed if there are no traps in any neighbouring cell.

Task 3

Test that your program works by loading the training game and showing that:

- a trap is detected after the player's first move, west
- a trap is detected after the player's second move, south
- a trap is not detected after the player's third move, west.

Evidence that you need to provide Include the following in your Electronic Answer Document.			
05.1	Your PROGRAM SOURCE CODE for the subroutine TrapDetector. [12 marks]		
05.2	Your amended PROGRAM SOURCE CODE for the subroutine PlayGame.		
	[1 mark]		
05.3	SCREEN CAPTURE(S) showing the required sequence of tests being carried out, with the trap detected message being displayed after each of the first two moves and the trap not detected message being displayed after the third move.		
	[1 mark]		
	The game of MONSTER!, as represented by the Skeleton Program , is to be extended so that the cavern generated is not rectangular. The outer cells, shaded in Figure 4 , will be randomly selected to be either rock or normal space when a new game starts. A cell that contains rock cannot be entered by the monster or player.		
	Figure 4		
0 5 . 4	Describe changes that could be made to the Skeleton Program to achieve this.		
	In your answer you should ensure that you discuss changes to the data held in the Cavern variable and how the subroutines ResetCavern and CheckValidMove will need to be altered.		
	You are not expected to actually make the changes.		
	[5 marks]		
05.5	A request has been made that the layout of the whole cavern should be more random. It has been suggested that all of the cells should be made a random choice between rock and normal space during setup.		
	Identify two problems that might occur with the MONSTER! game if this suggestion was made to the program.		
	[2 marks]		
	END OF QUESTIONS
