

## 3.5. Data Representation – Test 2

---

1. The following questions should be carried out without using a calculator. Show your working.

a) Convert 204 (base 10) to binary and hexadecimal.

i. Binary:

[1]

ii. Hex:

[1]

b) Convert 11000111 (base 2) to denary and hexadecimal.

i. Binary:

[1]

ii. Hex:

[1]

c) Convert E7 (base 16) to denary and binary.

i. Binary:

[1]

ii. Hex:

[1]

d) What is  $\frac{-3}{16}$  in two's complement notation?

[1]

.....

e) If 1100.1100 is a two's complement fraction, what is it in denary?

[2]

.....

.....

2. ASCII and Unicode are both methods of storing characters in a computer.
- a) Knowing that A is character 65 (base 10) in ASCII, give the ASCII codes for the following letters:
- i. F ..... [1]
- ii. M ..... [1]
- iii. X ..... [1]
- b) How many ASCII characters are in the following phrase? Explain how you arrived at your answer.  
**I love AQA Computer Science!** [2]
- .....  
.....  
.....
- c) The ASCII code for the letter 'E' is 100 0101. State the ASCII binary for the letter J. [1]
- .....  
.....
- d) Give an advantage of ASCII over Unicode. [1]
- .....  
.....
- e) Give an advantage of Unicode over ASCII. [1]
- .....  
.....
- f) How many characters can 7-bit ASCII represent? [1]
- .....  
.....
3. a) Using an example, describe how bit patterns can represent other forms of data such as graphics or sound. [2]
- .....  
.....
- b) A digital photograph has a resolution of 640 pixels by 480 pixels, and a file size of 1200 KB. Assuming the file is a simple raw bitmap (i.e. it contains no header or other extras), calculate the colour depth of the image. Show your working. [3]
- 
- c) Give examples of two pieces of information typically found in the metadata of a bitmapped graphic. [2]
- 1..... 2.....

4. Encryption is incredibly important in the modern age. Two popular methods of encryption are the Caesar Cipher and the Vernam Cipher.

- a) Encrypt the phrase 'I love computing' using the Caesar Cipher and a key of 5. [2]

- b) Decrypt the phrase 'kwux akq zwksa' using the Caesar Cipher and a key of 8. [2]

- c) Give two disadvantages of a standard Caesar cipher as a method of encryption. [2]

.....  
.....

- d) The Vernam Cipher is highly regarded – why is that? [1]

.....  
.....

- e) Explain how the Vernam Cipher works. You may assume a computer is carrying out the encryption, and binary is being used to represent each character. [4]

.....  
.....  
.....  
.....  
.....  
.....  
.....

- f) Aside from keeping the key text safe and secure, what other two rules must be followed to preserve the security of this Vernam Cipher? [2]

1.....  
.....

2.....  
.....

**Total marks = /38**
