

## 3.9. Communication and Networking

---

1. a) Define the following types of communication link:

i. Serial

[1]

.....

.....

ii. Parallel

[1]

.....

.....

- b) A company wishes to connect sites which are a considerable distance apart with their WAN.

Which sort of cabling would you advise them to use, serial or parallel, and why?

[2]

.....

.....

.....

2. A printer is connected to a computer via a USB (universal serial bus) link.

- a) USB uses asynchronous transmission.

i. What is asynchronous transmission?

[1]

.....

.....

ii. Asynchronous transmissions often use special bits to control the flow of data. What are these bits called and exactly what is it they do?

[2]

.....

.....

.....

- b) The alternative to asynchronous transmission is synchronous transmission.

Describe how synchronous transmission differs from asynchronous transmission and give an advantage of using synchronous transmission.

[3]

.....

.....

.....

.....

3. Describe what is meant by the following terms:

- a) Client-server networking

[2]

.....  
.....  
.....

- b) Peer-to-peer networking

[2]

.....  
.....  
.....

4. You are assessing an experimental high-speed communications link for use by your company.

- a) If the link has a bit rate of 200Gbps and a baud rate of 100Gbps, how many bits must be sent per signal change?

[1]

.....

- b) The link uses even parity bits to check for errors. There is one parity bit for every seven data bits.

- i. Explain what an even parity bit is and how it is used to check for errors.

[2]

.....  
.....  
.....

- ii. Does the byte 10110111 contain an error?

[1]

.....

- iii. What is the limitation of using only parity bits for error checking?

[1]

.....  
.....

- c) The link has been described to you as low latency. What does this mean?

[1]

.....  
.....

5. The Internet is very useful, however, connecting a computer to it exposes it to a number of threats.
- a) What is a firewall and how does it protect a computer? [2]

.....  
.....  
.....  
.....

- b) Two capabilities of a firewall system can be packet filtering and a proxy server. Describe what each of these capabilities are and what they try to achieve. [4]

1.....  
.....  
.....

2.....  
.....  
.....

- c) Define the term 'virus' and explain briefly how viruses work. [3]

.....  
.....  
.....  
.....

- d) Define the term 'worm' and describe how it differs from a virus. [2]

.....  
.....  
.....

- e) Define the term 'Trojan horse' and describe how it differs from a virus. [2]

.....  
.....  
.....  
.....

6. A home user is trying to set up a local area network which is connected to the Internet. They have drafted you in to help them set it up.
- a) What is a gateway and why will they need one to connect to the Internet in this example? [2]

.....  
.....  
.....

- b) They have bought a router. The router has an internal IP address of 192.168.1.1. The external IP address is provided by their Internet Service Provider.
- i. Explain what a router is and why it is necessary. [2]

.....  
.....  
.....

- ii. The router they have bought has a built-in wireless access point. Explain why it is better for the access point to use the Wi-Fi standard rather than other alternatives and what the security implications of a wireless network are. [2]

.....  
.....  
.....

- c) They have a printer with a network port. Suggest an appropriate static IP address for the printer, assuming a subnet mask of 255.255.255.0. [1]

.....

- d) Laptop computers connect to the network using Wi-Fi. They use carrier sense multiple access with collision avoidance (CSMA/CA) to determine when to transmit data.

Explain how the CSMA/CA method is used. [6]

.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....
