

## Mechanics 15 – Vector Calculus

Please **complete** this homework by \_\_\_\_\_. Start it early. If you can't do a question you will then have time to ask your teacher for help or go to a drop in session.

### Section 1 – Review of previous topics. Please complete all questions.

1)

**Figure 5**

Figure 5 shows two particles  $A$  and  $B$ , of mass  $2m$  and  $4m$  respectively, connected by a light inextensible string. Initially  $A$  is held at rest on a rough inclined plane which is fixed to horizontal ground. The plane is inclined to the horizontal at an angle  $\alpha$ , where  $\tan \alpha = \frac{3}{4}$ . The coefficient of friction between  $A$  and the plane is  $\frac{1}{4}$ . The string passes over a small smooth pulley  $P$  which is fixed at the top of the plane. The part of the string from  $A$  to  $P$  is parallel to a line of greatest slope of the plane and  $B$  hangs vertically below  $P$ . The system is released from rest with the string taut, with  $A$  at the point  $X$  and with  $B$  at a height  $h$  above the ground.

For the motion until  $B$  hits the ground,

- (a) give a reason why the magnitudes of the accelerations of the two particles are the same, (1)
- (b) write down an equation of motion for each particle, (4)
- (c) find the acceleration of each particle. (5)

Particle  $B$  does not rebound when it hits the ground and  $A$  continues moving up the plane towards  $P$ . Given that  $A$  comes to rest at the point  $Y$ , without reaching  $P$ ,

- (d) find the distance  $XY$  in terms of  $h$ . (6)

- 2) A particle  $P$  moves on the  $x$ -axis. The acceleration of  $P$  at time  $t$  seconds is  $(t - 4) \text{ m s}^{-2}$  in the positive  $x$ -direction. The velocity of  $P$  at time  $t$  seconds is  $v \text{ m s}^{-1}$ . When  $t = 0$ ,  $v = 6$ .

Find

- (a)  $v$  in terms of  $t$ , **(4)**
- (b) the values of  $t$  when  $P$  is instantaneously at rest, **(3)**
- (c) the distance between the two points at which  $P$  is instantaneously at rest. **(4)**

## Section 2 – Consolidation of this week’s topic.

Please complete all questions.

- 1) A particle moves on a plane such that its position at time  $t$  is given by

$$\mathbf{r} = (3t - 2)\mathbf{i} + (4t - 2t^2)\mathbf{j} \text{ m}$$

- a) Write expressions for the velocity and acceleration of the particle at time  $t$ . **(4)**
- b) Work out the initial speed of the particle. **(2)**
- c) At what time is the particle moving parallel to the  $x$ -axis? **(2)**
- d) Is the particle ever stationary? Give a reason for your answer. **(2)**
- 2) At time  $t$ , a particle has position given by  $\mathbf{r} = (2t - 1 + \cos t)\mathbf{i} + (\sin 2t)\mathbf{j}$ . The particle starts at the origin.
- a) Work out the value of  $t$  for which it next touches the  $x$ -axis. **(2)**
- b) For that value of  $t$ , work out its instantaneous velocity and acceleration, showing your working. **(4)**
- 3) The force acting on a particle of mass  $500\text{kg}$  at time  $t$  sec is given by  $\mathbf{F} = (2000t\mathbf{i} - 4000\mathbf{j}) \text{ N}$ . Initially the particle is at the origin and travelling with velocity  $10\mathbf{i} \text{ m s}^{-1}$ .
- Work out
- a) the speed of the particle when  $t = 2$ . **(5)**
- b) the distance of the particle from the origin at this time. **(4)**

- 4) A particle starts moving from the point with position vector  $(2\mathbf{i} + 3\mathbf{j})$  m and has a velocity given by  $\mathbf{v} = (10e^{-t}\mathbf{i} + 2\mathbf{j})$  ms<sup>-1</sup>

Find a) the acceleration when  $t = 1$  **(3)**

b) the position vector when  $t = 1$  **(4)**

- 5) An object moves on a plane so that its acceleration at time  $t$  sec is given by

$$\mathbf{a} = (-4\cos 2t\mathbf{i} - 4\sin 2t\mathbf{j}) \text{ ms}^{-2}.$$

It is initially at the point  $(1,0)$  and travelling at  $2\text{ms}^{-1}$  in the positive  $y$ -direction.

a) Show that the object moves with constant speed. **(3)**

b) Work out the distance of the object from the origin at time  $t$  and hence describe the path of the object. **(4)**

- 6) Two boats P and Q, move on the ocean, assumed to be a plane, with  $\mathbf{i}$  and  $\mathbf{j}$  as unit vectors acting East and North respectively. Initially P has velocity  $(2\mathbf{i} - 5\mathbf{j})$  ms<sup>-1</sup> and Q is travelling North at  $2\text{ms}^{-1}$ . After  $t$  sec, each boat has an acceleration of magnitude  $t$  ms<sup>-2</sup>. For P, this acceleration is towards the North East and for Q, it is towards the South East. Show that the acceleration of P is  $((\sqrt{2}/2)t\mathbf{i} + (\sqrt{2}/2)t\mathbf{j})\text{ms}^{-2}$  and find a similar expression for the acceleration of Q. Hence find the value of  $t$  for which the boats have the same speed.

**(6)**

- 7) A particle of mass 2kg is acted upon by the two forces  $F_1 = \begin{pmatrix} 2 \\ 4 \\ -3 \end{pmatrix}$ ,  $F_2 = \begin{pmatrix} x \\ 4 \\ 1 \end{pmatrix}$ .

Given that the magnitude of the acceleration is  $\sqrt{26} \text{ms}^{-2}$  find the possible values of  $x$  **(4 marks)**

- 8) A particle is in equilibrium when it is acted upon by the three forces

$$F_1 = 3\mathbf{i} + 2\mathbf{j} - k, F_2 = \mathbf{i} - 4\mathbf{j} + 5\mathbf{k} \text{ and } F_3 = 3\mathbf{i} + \mathbf{j} - 2\mathbf{k}$$

a) Find the exact magnitude of the resultant force **(2 marks)**

b) Given that the particle accelerates with magnitude  $\sqrt{6}\text{ms}^{-2}$  find the mass. **(1 mark)**

c) The third force is removed. Find:

i) the magnitude of the acceleration **(3 marks)**

ii) the direction of the acceleration, giving your answers as angles against the axes **(4 marks)**

**Total mark: 59**
